

Formulation for dermo-cosmetic products using Advanced Water S-100

Advanced Water S-100

Composition : H₂O (99,7%), Na, Si, K, P, Mg, Ca, Cl (0,3%)

Advanced Water is designed for so-called "minimalist" formulas. Advanced Water is both an **ACTIVE** and an **EXCIPIENT** and is sufficient on its own in most cases. It is self-preserving thanks to its high pH. Advanced Water S-100 is absolutely stable for years.

In the case of **formulation for dermo-cosmetics**, and under certain conditions, it can be mixed with other products (gelling agent such as CMC-Na, jojoba oil, glycerin, hyaluronic acid, etc...) as long as the pH remains above 11.00 once the stability tests have been carried out.

In any case, Advanced Water S-100 **cannot replace** traditional water in existing formulas because it is incompatible with the components of conventional formulas, which **quickly leads to a neutralization of the pH and molecular structures** of Advanced Water S-100.
